If you have recently changed the battery on your BMW or done a major repair for the engine or emission system, the on board computer has mostly been reset. This makes the car not ready for a smog check. In order for your car to pass the smog check, you need to do a drive cycle to get the OBC ready. This process can be either cost consuming or time consuming. You could either drive a whole miles hopefully the OBC is ready or do as BMW dealership had suggested to drive 30 miles, park the car in idle for 30 minutes, and repeat this process for at least times. Both of these methods are extremely time consuming but there is another way to get the OBC ready to pass the smog check. You will need to do a Driving

Cycle if you have replaced the battery, disconnected the battery, or cleared the codes after a repair. The Driving Cycle performs a diagnostic test on all the systems that the computer monitors. Fortunately, this cycle can be completed in at least 15 minutes if done correctly. Don't leave the key on before the cold start or there is a possibility that the heated oxygen sensor may not run. Run the engine for 2. The more electrical load, the better. If you can achieve a closed loop, then the Fuel Trim will also be tested. Turn off air conditioner, radio, and other loads. Apply a half throttle until you reach 55mph. Make sure to drive on the right most lane. Release your foot from the accelerator pedal. The vehicle must gradually coast down to 20mph. Now is a good idea to turn on your hazard warning lights to let other cars behind you be alert on what's going on. They may even high beam you in the process. This is why you need to already be in the most right lane. This performs additional diagnostics as well as the catalyst monitor. However, if the battery has been disconnected or the catalyst is marginal, it might take you 5 entire driving cycles to complete. If at any time you have to speed up, change lanes, or break steps , you must start the driving over. If the process goes well, you will only have to attempt this once, but it shouldn't take more than a few times to complete the Driving Cycle. Good luck! Good questions dcurrie2! I was thinking the samething. Can I leave my scanner hooked up while performing the drive cycle to see if everything are good to go? Reply 12 months ago. Thank you so much for the great instructions! I planned it around one of my tour routes and made it! Question 1 year ago on Introduction. If I only need to get the catalyst and o2 sensor ready incomplete do I still need to follow every step? Question 2 years ago on Step 2. I am leaving from my home I do not live on the highway so is there a break in between Step 2 and step 3 because I can't accelerate until I get to the highway which would be about 5 extra minutes will this break the cycle. Answer 2 years ago. After the min idle, I just drove about 3 miles to the highway and stayed under 55mph and not exceed rpm. Once on highway, I began the rest of the progress. After doing the cycle about 3 times just to be safe, I came to a complete stop in gear and stalled. Went to smog next day and passed! I know this post is a little bit old but I have to do this test because i recently installed a new battery on my 04 x5 3. Reply 2 years ago. Did you ever get an answer to your question? I am in the same predicament and trying to figure out how to get from Step 2 to step 3 without breaking the cycle but I see no new information on this question or any of the questions answer. Can you perform this on a dyno or on jackstands with the wheels in the air? That way you won't be on the road with an expired tag? I've read the test will be nullified if you exceed 60mph, give large fluctuations in throttle, or go over RPM. To make things easier, I use cruise control, but I'm not sure if that invalidates the test either More by the author:. You must maintain a steady speed of 55mph for 3 minutes. You will now maintain a steady speed of 55mph for 5 minutes. Once again, don't brake, shift gears, or press the clutch. This performs the same tests as step 5. Did you make this project? Share it with us! I Made It! Reply Upvote. RostamM 1 year ago. Answer Upvote. Jnard10 Question 2 years ago on Step 2. HieuH5 Jnard10 Answer 2 years ago. GuynelS 3 years ago. Jnard10 GuynelS Reply 2 years ago. I have the same questions as the last 4 comments can we get an answer. The initial models were of the four-door sedan body style, followed by the coupe, convertible, wagon "Touring" and hatchback "Compact" body styles in later years. The E36 was the first 3 Series to be offered in a hatchback body style. It was also the first 3 Series to be available with a six-speed manual transmission in the M3 , a five-speed automatic transmission and a four-cylinder diesel engine. The multi-link rear suspension was also a significant upgrade as compared to the previous generations of the 3 Series. All-wheel drive was not available for the E36, unlike the previous E30 and successive E46 generations. The E36 was named in Car and Driver magazine's 10Best list for every year it was on sale. Following the introduction of its successor, the E46 3 Series in , the E36 began to be phased out and was eventually replaced in Development of the E36 began in [3] and the exterior design was heavily influenced by aerodynamics, specifically the overall wedge shape, headlight covers and smaller wing mirrors. The production version of the E36 was launched in October , with press release in November and market launch in early In , the BMW M52 engine replaced the M50TU, resulting in the i model replacing the i and the addition of a new mid-range i model powered by a 2. In , the 3. In , its capacity was increased to 3. In , the tds model was released, which added an intercooler to the M In , the tds model was introduced, powered by the four-cylinder BMW M41 turbocharged and intercooled engine. All models are rear-wheel drive, since the E36 was not produced with all-wheel drive unlike its predecessor and successor. The hatchback "Compact" models use a rear semi-trailing arm suspension based on the older E30 3 Series design. This was done in order to save space due to the truncated rear end of the hatchback. The Alpina B6 2. The 3 Series Compact range of three-door hatchback models were introduced in , based on a shortened version of the E36 platform. The North American model range consisted of the models listed below. The i models were powered by the BMW M42 engine, which was used in
