Ac2000.2

Proposition 65 is a California law that applies to companies selling products in California. Proposition 65 requires warnings if a product contains any listed chemical present above very low levels. Proposition 65 is not a product safety law, but rather a "right-to-know" law. Businesses are required to provide warnings to comply with Proposition The list includes naturally occurring and man-made chemicals. Proposition 65 warnings can be seen for a wide variety of everyday consumer products, including electronic equipment, and warnings can be seen posted throughout California in a variety of establishments such as buildings, hotels, restaurants, coffee shops, and stores. The warning is part of our ongoing effort to comply with the California Safe Drinking Water and Toxic Enforcement Act of known as "Proposition 65". The lowest impedance accepted by this amplifier is 2 ohms. Amplifiers that are 2 ohms stable produce more power resulting in more volume. This amp can comfortably power speakers or subwoofers with all channel s being used at a load of 2 ohms. We have developed a specific linear circuitry that further reduces distortion while increasing both sound quality and power output. An amplifier with both high-level and low-level inputs provides flexibility by allowing you to build an audio system using virtually any standard factory or aftermarket source unit. High-level speaker level inputs accept the signal from the speakers, while low-level RCA inputs accept the signal from the pre-amp outputs of the source unit. If the amplifier gets too hot, the thermal protection circuit turns the amp off and allows the amp to cool down before turning it back on. If a speaker fails causing an electrical short, the protection circuit will automatically cut the output and remain in that state until the short is resolved. These safety features give you peace of mind knowing the amplifier is constantly monitoring conditions to protect itself. The ability to boost or attenuate the sub level when an amp and subwoofer are connected to the subwoofer pre-amp output. Switchable Input Sensitivity gives you the freedom to connect the amp to any standard source unit and have peace of mind it will be within range to properly match the output of the source unit allowing you to use the volume controls on your source unit the way it was designed. Variable Bass Boost allows you to adjust the low bass within the boost range to just the way you like it. Variable Gain Control lets you balance the amps output with the speakers or subs the amp is driving. To much gain will lead to distortion and to little will lead to clipping. Variable high-pass filter gives you control over the frequencies that pass through to the full range speakers. Variable low-pass filter gives you control over the frequencies that pass through to the subwoofer. April 26, moody. April 9, Amazon Customer. March 23, Amazon Customer. March 9, Mark Duncan. Measurement Width. Great amp Excellent bass amp when run at 2ohms. This amp will clip if it's hooked up wrong like any other once things are right, it's extremely reliable. Was this review helpful? Five Stars! Really packs a punch. Not even using the remote. Pushes the subwoofers to the max. Great investment! Amp rocks your truck an shakes gravel on your floor board Had this amp for awhile an it's the best amp for the price I have two watt punch speakers an it pushes them with a 2 ohm load. I love the bass it delivers. Sounds good when it works Sounds

good when it works. One type R is almost to much for it. If playing for around a hour it shuts off the sub. Five Stars sounds good in Ford F No complaints It's cheap so you get what you pay for, it will never deliver 2, watts and I don't think the 1, watt rms bridged is accurate either but I still am happy with it. Side note, be sure to wire your subs to the right ohms for the rated rms in the back of the manual! I really like this amp I really like this amp. I have it set on low pass for the speaker level control to be used up front. I haven't had any problems with it getting hot and it does make a lot of power if you know what your doing. I hear about people bashing this amp but they obviously don't know what they are doing so if your looking for a good amp for not a lot of money, BUY IT. You wont regret it. Great value and performance!!! Love it! It powers my fiance pioneer 12 sub with watt max and rms perfect. We have it bridged at 4ohms and it does its job perfect at a great price. Probably not the exact watts they advertise but not much less either. Looks nice in the car and her sub hits hard!! Just got me the dual 12 MTX Terminators. Can't wait for my jeep to shake my bones. Planet audio has found a new customer with this amp!! Sounds extremely nice, easy to hook up, came with the allen wrench to take the cover plate off to hook up the wiring. Over all no complaints aside from the bass knob not working. Have been using this amp for about 7 months and have not had a single issue. Definitely would recommend to a friend. But I do like the performance Powerful, clean booms. Powers my OEM 2x 8" shallow subs rated at 4ohm 70watt each. Need to keep the subwoofer level knob near minimum. Lots of little knobs on the amp. Had to get a little allen wrench to remove the metal covering above the terminals to get access to the screws. The unit runs very hot, so hot it hurts your fingers if you hold onto it for more than 2 seconds. The unit stopped working one time, just had to restart the vehicle to get it to work again. Not sure about that, whether caused by heat issue or not. But I do like the performance. Only had for one day, hope it lasts. Good amp If you're looking for a cheap amp to run dual 8" through 12" possibly 15" or mid and highs. This amp will do it. When I ran it through tests this is what I came up with, single 15" dual 4ohm rated Bridged 2ohm Bridged 4ohm A change in either direction will decrease wattage. Custom system this thing is sounnding great running two 12" subs at the moment I'm still working through the Toyota Tacoma Quad cab, Custom system this thing is sounnding great running two 12" subs at the moment. I'm contemplating it running " subs along with " subs? Performance is great so far! Highly Recommended Budget Amp. The amount of power you get from this for the price is a steal. I have 2 amps from Planet Audio.. I read a lot of reviews slamming this amp and when questioned why they either don't respond or turns out they have it hooked up to the wrong speakers ohm's This is When you are buying an amp or speakers just look it up and if you cant find the answer.. Make sure you get the right amp for your speakers and vise versa. If this amp is hooked up correctly it produces a very clean bass. It does not overheat. People buy these and crank the gain and bass boost and then complain about it being crappy sounding.. Well thats because you are clipping the heck out of it. You can set the gain by ear with a test tone you can find on youtube. It takes 5 minutes.. The functions on the side of the amp are pretty basic. If you don't know how to set those.. It does come with a remote subwoofer level control so you can adjust the amount of bass on the fly which is nice. This one is 0 to 18 db and works great. This amp is bridgeable. This is where you need to pay attention. You should have selected the right ohm speaker for this amp in stereo mode 2 channel but if you are running 2,3,4 speakers in series then you need to make sure this amp can handle the final ohm load that your speakers are asking for. Specs from PA website Watts at 2ohm x 1 Bridged Watts at 4ohm x 1 Bridged Watts at 2ohm x 2 Watts at 4ohm x 2 It is only 2 ohm stable as you can see from the specs Very good amp for the price. I got this amp about a month ago and I have to say I am nothing but impressed so far. It pushed the alpine perfectly without overheating or any other issues. Im running it on the bridged connection and it is working flawlessly. On the topic of heat, ive never seen this amp get hot enough to be concerning. I had a two hour drive with the sun going and the amp was warm, but not hot. I also have it mounted to the side of my sub box, where there is plenty of ventilation and it stays plenty cool. I have it powered by 8 gauge wire and it seems to be doing just fine. I was shocked by the size of the amp though, I expected it to be smaller than it was. Now for the adjustments and settings. It has all the basic stuff like gain and low pass frequency, but it also has bass boost, which I personally have turned off. Also, the adjusters can be turned by hand, or a flathead screwdriver. It will not affect the sub if its on high pass, or both low and high. This is a great buy for anyone looking for a cheap, but fantastic amp to push 1 or two subs. I love the amp, it really works well with my 2 alpine type s 12" .. Five Stars great amp for the price. Not a bad amp. No where near watts but I No where near watts but I knew it wouldn't be. If I had to guess maybe Gets very hot make sure to ground it well and remove the paint on the frame. Highly recommend elevating it off the box. Put a few wood blocks 2x1 inch then nail or screw the wood on the box then mount the amp on the wood. Amps noticeably cooler now. I'm pleased with the amp but its the 1st day only time will tell if it lasts and if

anything happens I'll update this! First off here are the ratings on this amp Watts at 2ohm x 1 Bridged Watts at 4ohm x 1 Bridged Watts at 2ohm x 2 Watts at 4ohm x 2 So if your thinking that your going to buy this amp to push 2 subs that have a rms at 4 ohm its not going to happen. This amp is not going to push those subs. Know what your buying. I've read reviews on this amp where people are complaining about that. SO overall this is a pretty good amp. It will do fine of your pushing a low to mid level sub or subs. Rockford prime or a P1, kicker comp, something like that. The amp does get hot but all depends on how high you have the amp set at. I'm only pushing the amp about half way and it only gets a little hot. If your going to put the amp under a seat i would screw it to a board and put like half inch spacers under because the vent is on the bottom. First off, I am a basshead from the late 80's early 90's. I have experience with many many amps. I read some reviews here that state it doesn't push like it claims. You need to learn how to hookup an amp. This amp is a steal for the price. If you are constipated, just sit in a vehicle with this amp. It has so much clean power you won't be after it's done with you. I will recommend this amp to anyone. I got King Kong in the trunk!!!!! I have had many amps in my past and this one takes the crown - this amp really hard - super clean and deep bass I have two JL audio subs and I have the amp down to the lowest power setting and its still rattling screws loose in my car - The only downside is now im going to have to thread lock my trunk bolts :. There's an equation that you can plug in the numbers to your amp and really figure out what this thing can do RMS wise. Mathematically anyways. It's not really real-world results but it's close to it. Usually, you can figure out the amount of amps this thing draws by adding up the rating on the fuses. Mine came with two 25's. Now you have to factor in the amps efficiency which is about percent for a class AB amp which this one is. Equations aside, this is an awesome amplifier! I think it looks really good, it's made out of awesome materials, and it kind of lights up blue. The Planet Audio logo is just plastic. The Anarchy text subtly lights up blue when the amp is powered on. I love all of the options this amp provides, I absolutely love how it comes with a remote so you can dial in the level that you want on top of your preset level on the amp itself, and it's really quiet. No fans. Just passive heating technology, which is fine! I haven't used this amp for extended periods of time. About an hour at most, and it hasn't overheated on me. I hope this amp lasts me a long time as for I'm really happy with it and I'm really hoping it stays that way! Worth It, Pleasent Surprise I just bought his amp yesterday and i installed it and took it for a test drive today. I have to say i was skeptical at first because i was replacing my watt, unrated and non-fused JL audio amp with a brand that i never heard of for a fraction of the price. Just for perspective my previous setup was the JL audio G monoblock amp pushing 2 Kicker 07CVR speakers wired to 1 ohm on an 80 amp fuseblock. So i was pulling waaaaay more wattage out of my watt amp than it was rated for. Decided i was gonna match my speaker correctly at 2 ohms and throw that old amp in the wife's car. I got the new amp installed and took it away from the house so i could really turn it up. I actually had to turn the gain down because my dynamated truck was starting to rattle again 99 Ford Expedition. I still need to mess with the setting a bit more to find my sweet spot but i have to say its a good buy. If i manage to overheat it or throw it into protection mode I'll post another review. Just thought i would try to give a comprehensive review in stead of "it's nice" or "works great". A very solid Amp Alight, I hooked this amp up bout weeks ago and it is amazing. A lot of amps get hot after long periods of use and this one does not. It gets a little warm buts thats normal. Quality is amazing, the bass is clean. I would recomend this amp to anyone Platinum Dealer - Free Extended Warranty. Compare AC User Manual in English. User Manual in English V2. Buy from Walmart. Buy from Fry's Electronics. Other features include the input sensitivity selector, low level high inputs, power and protection LEDs and heavy duty set-screw style terminals. Bridge this amplifier to 4 ohms to get the functionality of a mono block amplifier. This amp will not only turn heads with its power handling, but will also look the part with an illuminated Planet Audio logo. We recommend at least a 8 gauge wiring kit to hook up this amplifier to your car. Ibought tow of these amps through Amazon because they add an extra three years to the warranty, and I have to tell you, they are the ticket. I have each of them hooked up to a 12" drive in ported enclosures. One in my wife's Jeep and one in my van. They both are set at about one fourth of the power available and are wired mono into 4 ohms. They are all the amp either of us need. Forget looking out your rear view mriror, because these things shake your entire vehicle. I bought the watt madel really watts RMS because it had the best ratings of all the Planet Audio lineup. This amp is among the best I own, and was one of the least expensive. If you are looking at sub amps, look no further. These amps will do as good as any amp out there. Spend your money on a decent driver. Most of the reviews are talking about Kick this or Fos that Buy a decent driver from Parts Express or Madisound, and get an enclosure which is the proper size for the driver. All drivers have an optimal internal volume they require to properly reproduce the frequency range they are designed to reproduce. Then and only then, will you hear what this

amp is capable of doing. Spend your money on a good driver and a nice ported my favorite box, and you will really hear what was intended to be heard. Also make sure you know what you are doing in wiring the system and getting the proper impedence load for the amp you are using. I see all these people running 3 or 4 subs in th

1965 ford trucks
2009 honda civic stereo wiring diagram
p400 4 rockford fosgate amp

 eir car. Tha is just plain dumb. One good 12" driver will run you out of your vehicle if it is properly installed. Even though an amp says it is on ohm stable, most ae designed to run a four ohm load, so make sure you run a four ohm load. Don't run one ohm and torment the amp and think it is all good. It is not. I'll stop preaching now and sum up by saying that properly installed and mated with a good driver and properly constructed and sized and tuned enclosure, this amp is as good as anything else avalilable to you in the marketplace..
